

Solution Requirements

Introduction:

Solution requirements define the necessary features and functionalities required to address the identified problem and achieve the project objectives effectively.

Functional Requirements:

- The system should allow users to create and manage incident tickets.
- The system should support automatic assignment of incidents to appropriate teams.
- The system should enable creation and management of child incidents.
- The system should allow integration of change requests with incidents.
- The system should support SLA tracking and notifications.
- The system should enable creation and management of knowledge articles after resolution.
- The system should provide status updates and communication to users.

Non-Functional Requirements:

- The system should provide quick response and high performance.
- The system should ensure data security and user access control.
- The system should be reliable and available for continuous usage.
- The system should provide an easy-to-use and user-friendly interface.
- The system should support scalability for handling multiple incidents.

Technical Requirements:

- The solution should be implemented using the ServiceNow platform.
- The system should support ITSM modules such as Incident, Change, and Knowledge Management.
- The system should integrate with configuration items (CI) for better tracking.
- The system should support reporting and dashboard features for monitoring.

Conclusion:

The defined solution requirements ensure that the system effectively improves incident management, enhances efficiency, and provides better user experience through automation and integration.
