

User Acceptance Testing (UAT)

Introduction:

User Acceptance Testing is conducted to verify whether the system meets user requirements and expectations.

Objective:

The objective is to ensure that the system provides a user-friendly experience and fulfills all functional requirements.

Testing Process:

End users and service desk agents tested the system by creating incidents, tracking their status, and verifying resolution updates. Features such as change request integration, child incident management, and knowledge article creation were also validated.

Results:

Users confirmed that the system is easy to use and meets the expected requirements. All major functionalities worked as intended.

Conclusion:

User Acceptance Testing confirmed that the system is ready for deployment and successfully meets user needs and project objectives.
