

Customer Journey Map

Introduction:

The Customer Journey Map illustrates the end-to-end experience of a user while interacting with the incident management system. It helps in understanding each stage of the user's interaction and identifying areas for improvement.

Stage 1: Issue Identification

The user experiences a problem, such as inability to connect to the VPN. This creates a need to seek support from the IT service team.

Stage 2: Incident Creation

The user reports the issue by creating an incident ticket in the system or contacting the service desk. Relevant details such as description, category, and urgency are provided.

Stage 3: Ticket Assignment and Analysis

The incident is assigned to the appropriate team (e.g., Network team). The support team analyzes the issue and identifies the root cause.

Stage 4: Resolution and Change Integration

The issue is resolved by taking necessary actions, such as restarting the VPN service. If required, a change request is created and linked to the incident for proper tracking.

Stage 5: Communication and Updates

Throughout the process, the user receives updates regarding the status of the incident, ensuring transparency and better communication.

Stage 6: Closure and Feedback

Once the issue is resolved, the incident is closed. Knowledge articles may be created for future reference, and the user provides feedback on the service experience.

User Experience (Across All Stages):

The user may feel frustrated during delays but satisfied when the issue is resolved quickly with proper communication and transparency.

Conclusion:

The Customer Journey Map helps in identifying key touchpoints and improving the overall user experience by ensuring efficient incident handling, faster resolution, and better communication using ServiceNow.
