

Technology Stack

Introduction:

The technology stack defines the set of tools, platforms, and technologies used to develop and implement the project solution.

Platform:

The project is developed using the ServiceNow platform, which provides integrated IT Service Management (ITSM) capabilities for handling incidents, change requests, and knowledge management.

Modules Used:

The system utilizes core ITSM modules such as Incident Management, Change Management, and Knowledge Management to support end-to-end service operations.

Frontend:

The user interface is provided by the ServiceNow web-based platform, which offers an intuitive and user-friendly workspace for service desk agents and end users.

Backend:

The backend processes are managed within the ServiceNow platform, including workflows, business rules, and automation for incident handling and resolution.

Database:

ServiceNow uses a centralized database to store incident records, change requests, configuration items (CI), and knowledge articles for efficient data management.

Integration and Tools:

The platform supports integration with configuration management database (CMDB), SLA tracking tools, and reporting dashboards for monitoring performance and improving decision-making.

Conclusion:

The selected technology stack ensures a robust, scalable, and efficient solution for managing incidents, automating processes, and improving overall IT service management.
