

Performance Testing

Introduction:

Performance testing is conducted to evaluate the system's responsiveness, stability, and efficiency under different workloads.

Objective:

The objective is to ensure that the ServiceNow-based incident management system performs efficiently while handling multiple incidents without delays.

Testing Process:

The system was tested by creating multiple incident tickets, assigning them to different teams, and processing them simultaneously. Workflow execution, SLA tracking, and response times were monitored to assess system performance.

Results:

The system showed stable performance with quick response times and efficient processing of incidents. No significant delays were observed during ticket creation, assignment, or resolution.

Conclusion:

Performance testing confirmed that the system is reliable, scalable, and capable of handling real-time incident management efficiently.
