

Brainstorming and Idea Prioritization

Introduction:

As part of the ideation phase, the team conducted brainstorming sessions to identify key challenges in IT service management, particularly focusing on issues such as VPN connectivity failures, delayed incident resolution, and inefficient tracking mechanisms.

Idea Generation:

All team members actively participated and contributed ideas in an open and collaborative environment. The ideas generated included automation of incident assignment, creation of child incidents for improved tracking, integration of change requests with incidents, monitoring of Service Level Agreements (SLAs), and automatic generation of knowledge articles after issue resolution.

Idea Evaluation and Prioritization:

After generating ideas, they were evaluated based on feasibility, impact, and relevance to the project objectives. The most effective and practical ideas—such as incident lifecycle management, change integration, knowledge creation, SLA tracking, and multi-team collaboration—were prioritized for implementation.

Conclusion:

The prioritized ideas were successfully implemented in the ServiceNow-based project to improve efficiency, ensure better tracking, and enhance overall incident management processes.
