

Data Flow Diagrams and User Stories

Data Flow Diagrams (DFD):

Introduction:

Data Flow Diagrams represent how data moves through the system and how different components interact in the incident management process.

Level 0 (Context Diagram):

The system consists of external entities such as Users and IT Support Teams interacting with the ServiceNow system. Users submit incident requests, and the system processes them and provides updates and resolutions.

Level 1 Diagram:

The incident management process is divided into multiple stages:

- Incident Creation: User submits issue details.
- Incident Assignment: Ticket is assigned to the appropriate team.
- Incident Processing: The team analyzes and works on the issue.
- Change Integration: If required, a change request is created and linked.
- Resolution and Closure: Issue is resolved, knowledge article is created, and the ticket is closed.

Conclusion (DFD):

The DFD helps in understanding the flow of information and ensures proper coordination between users and the support team.

User Stories:

Introduction:

User stories describe the system requirements from the user's perspective, helping to design features that meet user needs.

User Stories:

- As an end user, I want to report an issue easily so that I can get support quickly.
- As a service desk agent, I want to assign incidents to the correct team so that issues are resolved efficiently.
- As a support engineer, I want to analyze and resolve incidents so that system functionality is restored.
- As a change manager, I want to create and link change requests so that system changes are tracked properly.

- As a user, I want to receive updates on my incident so that I know the status of my request.
- As an administrator, I want to track SLA performance so that service quality is maintained.
- As a knowledge manager, I want to create knowledge articles so that similar issues can be resolved faster in the future.

Conclusion (User Stories):

User stories help in clearly defining system requirements and ensure that the solution is user-focused and efficient.
