

Empathy Map Canvas

Introduction:

The Empathy Map Canvas is used to understand the users' needs, thoughts, and challenges in the incident management process. It helps the team gain deeper insights into user behavior and expectations.

Says:

Users report issues such as "Unable to connect to VPN," "System is not responding," and expect quick support and timely updates from the IT team.

Thinks:

Users often think that the issue should be resolved quickly and expect a reliable system. They also assume that the IT team should have proper tools to handle incidents efficiently.

Does:

Users create incident tickets, follow up on their requests, and communicate with the service desk for updates. They rely on the system to track the progress of their issues.

Feels:

Users feel frustrated when there are delays in resolution or lack of communication. They feel satisfied when issues are resolved quickly and efficiently.

Pain Points:

Major pain points include slow response time, lack of transparency in ticket status, repeated issues like VPN failures, and poor knowledge availability for self-resolution.

Gain Points:

Users benefit from faster resolution, clear communication, proper tracking of incidents, and availability of knowledge articles for quick problem-solving.

Conclusion:

The Empathy Map Canvas helps in identifying user expectations and challenges, enabling the team to design an efficient and user-centric incident management system using ServiceNow.
